Outline of Doctoral Program in the Graduate School of Engineering, Nagaoka University of Technology

I The Objective of the Doctoral Program

The aim of the Doctoral Program in the Graduate School of Engineering is to develop high-level research ability and prolific knowledge, which are indispensable for conducting self-reliant research in a specific field of study.

II Educational and Research Courses and Fields

Under the university's basic policy an integrated curriculum is provided as a unified course of study that begins in the undergraduate years and continues systematically through graduate studies.

The Doctoral Program, on the other hand, has been organized by scrapping the undergraduate-to-master's programs and rebuilding them into a revolutionary system of education and research to allow even more advancement of an interdisciplinary nature and epoch-leading role. Accordingly, the Doctoral Program consists of four courses, i.e., Energy Engineering, Information Science and Control Engineering, Materials Science, and Civil Engineering and Bioengineering. These four courses are composed of many educational and research fields each of which, in turn, is organized by assembling several integrated chairs belonging to different disciplinary areas.

This system provides academic achievement in each field of study, vigorous development of new fields, advancement of the study itself and the training of high level researchers.

Details of the courses and the three fields in each are given below.

1. Energy Engineering

Human beings have established a highly-developed civilization through the progress of technology. In order to maintain this prosperous situation, we need to solve existing problems of population, cities, resources, and the environment to keep the balance between nature and our human society. There are two measures to do this: one is to develop new energy sources and advanced energy-related devices and systems, and the other to evolve methods for saving energy resources. The Energy Engineering course covers the following three fields, which all aim to keep the balance between nature and our human society.

(1) Energy Systems Engineering

The exhaustion of fossil fuel is of an urgent issue. In order to solve this, we need not only to improve efficiency in the utilization of existing fuels, but also to develop new energy sources such as renewable energy. Addressed in this area are many problems that cannot be solved only by a method in any particular, established research field.

This field aims (i) to improve the performance of equipment through studies on particular energy technologies and methods (transportation, storage, and transformation) and on various energy types including heat, nuclear, electrical, and mechanical energies; (ii) to integrate related technologies in different research fields of environment, materials, control, etc.; and (iii) to systematize technologies and methods to build up a sustainable energy system, in which the concept of the system safety engineering is introduced to secure the safety, especially in the proper usage of nuclear energy.

(2) Energy Conversion, Control Engineering

Thermal, electrical, and mechanical energy generated from energy sources is utilized through complex processes. These energies need to handle various conversion processes depending on the application. In addition, advanced control technology is required to improve the conversion efficiency and economic efficiency of various processes and systems. In this specialized area, research and development of energy conversion and control technologies are conducted for this purpose.

This field aims (i) energy conversion and control engineering to improve energy efficiency and economy of various energy systems, (ii) research and technology development for effective utilization of various energy sources; and (iii) control technology and safety engineering for safe and secure energy utilization.

(3) Energy Materials Engineering

New material is required in the development in energy technology that contributes toward effective utilization and saving of energy sources and improvement in processes of transportation, storage, and transformation of energy. Newly developed materials can be applied to energy-related devices.

Aims of this field contain: (i) effective utilization of nuclear resources; (ii) chemical transformation of solar energy by photosynthesis; (iii) optimization of energy transmission; and (iv) development of functional materials for higher efficiency and saving of energy.

University Staff and Fields of Research

(1) Field of Study: Energy Engineering

PROFESSORS

NAME	RESEARCH FIELD	RESEARCH TOPICS
JIANG, Weihua	Power engineering Electron device Plasma science	1) Compact pulsed power generator 2) High power microwave generation 3) High energy-density science 4) Plasma Applications
SUEMATSU, Hisayuki	Inorganic materials Physical properties	1) Development of material preparation methods utilizing extreme conditions 2) Synthesis of novel superconductive, magnetic and other novel materials
SUZUKI, Tatsuya	Nuclear Chemistry Radiochemistry	1) Nuclide Separation & Partitioning 2) Isotope Effect / Isotope Separation 3) Plasma Chemistry 4) Nuclear Reprocessing Engineering 5) Nuclear Fuel Cycle Engineering
TAKAHASHI, Tsutomu	Fluids engineering	1) Rheo-optic behavior of complex fluids 2) Elongation flow behavior of complex fluids 3) Flow of surfactant solutions, cosmetics and slurries 4) Control and effective utilization of Flow-induced vibration 5) Energy harvesting from wind and river flow
LI, Zhidong	System design for low-carbon society Energy and environmental policy	1) Low-carbon System 2) Energy Economics 3) Environmental Economics 4) Econometrics

ASSOCIATE PROFESSORS

NAME	RESEARCH FIELD	RESEARCH TOPICS
OHTA, Tomoko	Environmental radioactivity	1) Environmental radioactivity 2) Groundwater dating 3) Forestry Hydrology 4) Backend
KATSUMI, Toshiyuki	Combustion Engineering Aerospace Engineering	1) Combustion energy 2) Combustion safety 3) Rocket propellant combustion
SUZUKI, Masataro	Thermal engineering Fluid engineering	1) Fire Safety Engineering 2) Combustion 3) Reactive-Fluid Dynamics 4) Thermophoresis
TAKEZAWA, Hiroki	Nuclear System Engineering	1) Integrated numerical analysis of nuclear systems 2) Monte Carlo particle transport calculation 3) Small and micro reactors design 4) Criticality safety analysis 5) Nuclear batteries design
YAMAZAKI, Wataru	Computational Fluid Dynamics Aerospace Engineering	1) Aerodynamic Design 2) Optimization Algorithms 3) Airfoil and Wing 4) Fluid Machinery
SATO, Daisuke	Thermal Engineering Safety Engineering Energy Engineering	1) Heat transfer 2) Combustion 3) Safety/Reliability design 4) Renewable energy conversion (solar, hydrogen, hydrocarbon) 5) Energy conversion device

SPECIALLY APPOINTED ASSOCIATE PROFESSOR FOR ACADEMIA-INDUSTRY FUSION

NAME	RESEARCH FIELD	RESEARCH TOPICS
FUJISAWA, Kei	Mechanical and Information Engineering	1) Industrial IoT 2) Automation 3) Numerical simulation

(2) Field of Study: Energy Conversion, Control Engineering PROFESSORS

NAME	RESEARCH FIELD	RESEARCH TOPICS
ITOH, Jun-ichi	Power electronics Power conversion Motor drive system	1) Development of simple, high efficiency and high performance power converter 2) Development of AC/AC direct power converter 3) High performance and simple Motor control
KADOWAKI, Satoshi **	Thermal engineering Safety engineering	1) Combustion 2) System Safety 3) Fire & Explosion 4) Risk Assessment
MIURA, Yushi	Power Engineering Power System Engineering Power Electronics	1) Distributed Generations 2) Smart Grid 3) Microgrid 4) Applications of Power Electronics in Power System
MIYAZAKI, Toshimasa	Dynamics Control	1) Motion Control 2) Mechatronics 3) Robotics
YAMADA, Noboru	Energy Engineering Thermal Engineering Optics and Photonics	1) Solar energy (photovoltaics and solar thermal applications) 2) Power generation from low-grade heat sources 3) Energy storage (mechanical battery, etc.) 4) Heat transfer

ASSOCIATE PROFESSORS

NAME	RESEARCH FIELD	RESEARCH TOPICS
KIKUCHI, Takashi	Nuclear fusion science	1) Beam Physics and Engineering 2) Nuclear Fusion 3) Computational Science 4) Plasma Science
KOBAYASHI, Yasuhide	Control engineering Dynamics Control	1) Robust active noise control of ducts 2) Disturbance attenuation control on water surface 3) Robust speed control of rotary systems
SASAKI, Toru	High Energy Density Physics Thermonuclear Fusion	1) High Energy Density Physics 2) Pulsed Power Generation 3) Thermonuclear Fusion 4) Plasma Science and Applications
HIDAKA, Yuki	Motor, Motor drive Numerical simulation AI/AR applications	1) Development of high power, torque, efficiency motor 2) Advanced numerical simulation for motor designing using shape optimization, electrical circuit, mathematical model 3) Advanced motor design using AI/AR techniques

YOKOKURA, Yuki	Motion Control Motor Drive Robotics	1) Motion Control of Robotics and Mechanical System 2) High Performance Motor Drive 3) Vibration Suppression Control of Geared Motor System
----------------	---	---

SPECIALLY APPOINTED ASSOCIATE PROFESSOR FOR ACADEMIA-INDUSTRY FUSION

NAME	RESEARCH FIELD	RESEARCH TOPICS
KUSAKA, Keisuke	Power Electronics	1) Power converters 2) Wireless power transfer 3) Energy conversion

(3) Field of Study: Energy Materials Engineering PROFESSORS

NAME	RESEARCH FIELD	RESEARCH TOPICS
SUZUKI, Tsuneo	Accelerator applications, novel material design	1) Chemical analysis by electrostatic accelerator 2) Light ion implantation 3) Novel material design and synthesis of new material
TAKEDA, Masatoshi	Functional materials	1) Energy conversion materials 2) Energy conversion, system 3) Electronic properties of Boron-rich semiconductors
HONMA, Tsuyoshi	Functional glass materials	1) Sodium Ion Batteries 2) Lithium Ion Batteries 3) Ionic Conductive Materials 4) Crystallization Mechanism of Glass Materials

ASSOCIATE PROFESSORS

NAME	RESEARCH FIELD	RESEARCH TOPICS
SHIRONITA, Sayoko	Metal Surface Science	1) Chemistry Polymer Electrolyte Fuel Cell Materials 2) Safety of Secondary Battery Nano-sized Metal
TAGAYA, Motohiro	Biomaterials Engineering	1) Nano-Bio Materials 2) Biomaterials Engineering 3) Bioceramics 4) Mesoporous Materials 5) Calcium Phosphate Compounds

2. Information Science and Control Engineering

The focus of research in technology has shifted from concentrating on highly specialized areas of study to a multi-disciplinary approach. Space development, ocean development, and robotics are such examples.

This course adapts such an interdisciplinary approach. It includes the fields of knowledge/information engineering, information system technology, and control engineering.

The aims of the course are:

- (i) to improve computation, image processing, and radio and light wave technologies;
- (ii) to improve super-precision measurement and control technology and super precision processing technology; and
- (iii) to develop machine mechanisms and production system control technology through the integration of these technologies.

(1) Knowledge and Information Systems Engineering

Knowledge engineering concerns the development of human abilities such as learning, skill, sense, and cognition. One of the achievements has been robotics. Sensing and cognition are yet to be developed. This field deals with technologies for processing pattern information and related intelligent information. It also attempts to improve mechanisms carrying a complex array of various elements including some aspects of industrial and management systems science.

(2) Information Systems Technology

The development of high-speed transmission and processing technologies utilizing radio/optical wave engineering and high performance computers has contributed to the development of modern society and has become indispensable to every aspect of technology. This field aims to utilize this high-tech research to develop integrated technologies such as combining image processing, sound/speech processing, and electric waves and to contribute to these fast growing areas in the application of information technology.

(3) Precision/Control Systems Engineering

This field is concerned with precision engineering, production engineering, and advanced control engineering using computer technology.

Recent research activities have focused on the following:

- (i) dynamics and noise of machine elements, super-precision mechanisms and mechatronics devices;
- (ii) super-precision material processing using laser beams, ion beams and electron beams, and solidification theory;
- (iii) super-precision machining and grinding;
- (iv) dynamic machine design theory and CAD/CAM systems;
- (v) advanced control theory and its application to precision machines and industrial robots;
- (vi) nanometer measurement technology;

- (vii) texture measurement technology and its application to glacier dynamics.

This course also provides a program on “Safety Engineering”. This program aims to take a leading role in the development in safety certification, risk evaluation, development of safety technology based on global safety standards, safety design, risk management, safety management, and safety culture of organization

University Staff and Fields of Research

3. Materials Science

For promoting original and creative technologies, one key is to develop new materials which can bring forth innovations in technology. Requirements for materials nowadays have become wide and complicated, and the number of materials has become very large with the development of composite materials. In order to cover the requirements for materials, the materials science course provides the following three fields.

(1) Structural Materials Engineering

Since the area of human activity has expanded to the polar and deep sea, or even to outer space, the requirements for structures and facilities have become highly elaborate and complicated. The materials which compose the structures and facilities are being used even in severe circumstances. In this field, mechanical properties of a number of materials are to be grasped systematically in view of macro-, micro- and nano-level analyses. Eventually, structural materials which process high specific strength properties are to be developed.

(2) Functional Materials Engineering

As technology improves, materials with new highly performative functions need to be created. The functions of materials are determined by factors such as the kind of atoms, molecular structure, crystal structure, and electronic structure of its constituents. Recently the field of functional materials engineering has rapidly developed: e.g., 1) the development of (i) electronic devices such as a super fast semiconductive element, which was realized by virtue of new functional and artificial crystals, and (ii) light emitting devices with new functions; 2) high temperature oxide superconductors, and 3) realization of highly functional organic materials. This field concentrates on the following: (i) control of electronic and crystal structure based on condensed matters; (ii) organic materials with value-added function and useful high-polymer materials; (iii) performance evaluation; and (iv) creation and development of new functional materials and new function elements.

(3) Intelligent Devices Engineering

In order to realize high functionality in various devices, machines, and equipment, it is necessary not only to process information obtained from sensors by feeding it into artificial intelligence and machine learning, but also to further enhance the functionality of sensing devices themselves and develop novel micro/nano devices that can be called intelligent devices. Through the development of new materials and processing technologies that contribute to sensing of electromagnetic waves (THz to X-rays) and high-density information transmission technology, force sensing and ultrasonic sensing, and innovative manufacturing and evaluation technologies related to micro/nano technology, we will conduct research and development on the creation, analysis design, and control of advanced materials and structures.

4. Civil Engineering and Bioengineering

1. Advancements in science and technology have enabled humans to build an advanced civilization through industrial development. However, the cost of continued development focused on human convenience has been a major threat to social safety and environmental sustainability. Problems have arisen in terms of harmony between nature and human society, such as the occurrence of increasingly serious natural disasters, the deterioration of living environments and sanitary functions in the growing urban areas, and the destruction of the environment and loss of biodiversity on a global level. It is necessary to solve these problems and realize the construction of a sustainable society. Thus, social demand is increasing more than ever, such as the development and maintenance of social infrastructures, the establishment of advanced disaster prevention and mitigation technologies, energy conservation, and resource recycling technologies.

2. In order to solve the above-mentioned problems facing our society, we conduct research and education in the three fields, (i) Civil Infrastructure and Disaster Resilience System Engineering, (ii) Environmental Management Engineering, and (iii) Environmental and Biological Engineering. These fields, concerning the planning and maintenance of sustainable social infrastructure systems equipped with advanced disaster prevention and mitigation technologies, the development and operation of environmental technologies according to situations, and the development of technologies to utilize the functions of organisms and biological molecules to improve social life, including environmental preservation, medicine, and welfare.

(1) Civil Infrastructure and Disaster Resilience System Engineering

It is important to properly plan, design, construct, and maintain social infrastructure facilities in order to enable us to live a cultured and humane life in an environment that is changing globally every day, such as global warming. The objective of the field of Civil Infrastructure and Disaster Resilience System Engineering is to build a better society and construct robust and sustainable civil infrastructural systems that are safe and secure against all kinds of disasters. For this purpose, the scope covers a wide range of topics, such as identifying and developing the characteristics of various materials used in social infrastructure, constructing simulation technology, upgrading disaster prevention systems by monitoring with information technologies, and predicting the future using big data and artificial intelligence. Practical and creative research will be carried out to construct next-generation social infrastructures in harmony with the environment.

(2) Environmental Management Engineering

To realize a sustainable society in this age of highly advanced human activity, it is necessary to understand the global material cycle and to plan and implement projects from a comprehensive perspective that considers both the nature and the social environment. In the field of Environmental Management Engineering, we aim to develop the social systems that are adapted to the local climate. For this purpose, we will elucidate natural disasters, develop disaster prevention measures, and define the proper role of social facilities by

conducting a wide range of research, such as elucidating natural phenomena, the development of appropriate processing technologies, and simulation by modeling, in the field from the global water cycle to the regional circulation of resources and energy.

(3) Environmental and Biological Engineering

Biotechnology is expected to contribute to a sustainable society in various fields such as environmental preservation, energy production, medicine, and food production. The objective of the field of Environmental and Biological Engineering is to develop technologies to improve human life and the global environment by effectively utilizing the functions of living organisms and bio-derived molecules. Our field conducts a wide range of basic and applied research related to industrial waste removal, biomass utilization, environmental assessment and preservation, genome breeding, and the development of medical devices.

NAKAMURA, Fuminori	Maintenance management engineering Coastal engineering	1) Durability of concrete structures 2) Numerical simulation of coastal waves and winds
FUKUMOTO, Yutaka	Geotechnical engineering	1) Computational geomechanics 2) Granular mechanics
MATSUKAWA, Toshiya	Urban planning	1) Land Use Planning System 2) Town Planning in Local City 3) Master Plan 4) Zoning 5) Area Division
MATSUDA, Yoko	Disaster management	1) Participatory disaster planning 2) Disaster resilience 3) Case study and Fieldwork
MIYASHITA, Takeshi	Maintenance management Structural engineering	1) Structural health monitoring 2) Steel structural engineering
KATO, Teppei	Transportation Planning Traffic Engineering	1) Transportation Network Analysis 2) Cost Benefit Analysis 3) Traffic Flow Theory

(2) Field of Study: Environmental Management Engineering

PROFESSORS

NAME	RESEARCH FIELD	RESEARCH TOPICS
KOMATSU, Toshiya	Environmental engineering	1) Solid and hazardous waste management 2) Biomass utilization technology 3) Environmental bioassay evaluation
YAMAGUCHI, Takashi	Civil and environmental Engineering Environmental technology, Environmental materials	1) Environmental Protection Engineering 2) Environmental Microbiology 3) Environmental Biotechnology 4) Water and Wastewater Engineering 5) Solid Wastes Technology
LU, Minjiao ***	Hydrology Hydraulic engineering Natural disaster science	1) Hydrology 2) Hydrometeorology 3) Water Resources 4) Snow Engineering 5) GIS and remote sensing

ASSOCIATE PROFESSORS

NAME	RESEARCH FIELD	RESEARCH TOPICS
KUMAKURA, Toshiro	Meteorology Natural disaster science	1) Snow science 2) Model simulations on atmosphere and snow pack 3) Storm and snow disaster analysis 4) Development of meteorological and snow observation technique
TAKAHASHI, Kazuyoshi	Remote Sensing Engineering and GIS Agricultural Information Engineering	1) Airborne LiDAR measurement 2) Crop Growth monitoring and estimation
HATAMOTO, Masashi	Civil and environmental engineering Environmental biotechnology	1) Waste water treatment 2) Microbial community analysis 3) Environmental microbiology 4) Isolation and detection of microorganisms
HIMENO, Shuji	Civil and environmental engineering	1) Solid Waste Management 2) Sewerage Treatment 3) Chemical Engineering 4) Separation Engineering
MAKI, Shinya	Environmental biotechnology	1) Preservation technology of plant genetic resources 2) Food engineering 3) Horticulture technology 4) Water and Soil environmental technology

(3) Field of Study: Environmental and Biological Engineering

PROFESSORS

NAME	RESEARCH FIELD	RESEARCH TOPICS
OGASAWARA, Wataru	Biorefinery Development of filamentous fungi Cellulosic Biomass Microbial genome analysis Cellulose and Protease	1) Biorefinery 2) Biomass 3) Fungi 4) Bio-ethanol 5) Cellulose
KIDOKORO, Shun-ichi *	Molecular Biophysics Protein Physics Statistical Biothermodynamics	1) Calorimetric evaluation of protein stability and molecular function 2) New methodology for the analysis of the physical properties and function 3) Rational molecular design of biological nanomachine
SHIONOYA, Akira *	Sports science and sports engineering Dynamics / Control	1) Development of the parallel measurement system for Mechanical parameter and physiological parameter 2) Development of the floating biofeedback system for mental health 3) Development of the Anaerobic Threshold Determination System 4) Development of sport-type wheel-chair
TAKAHASHI, Shouji	Applied Biochemistry Applied Microbiology	1) Engineering and application of D-amino acid-metabolizing enzymes 2) Microbial degradation of environmental pollutants 3) Molecular breeding of biotechnologically valuable yeasts
TAKIMOTO, Koichi ***	Molecular physiology Cell biology	1) EAG2 channel and cancer cell growth 2) Novel drugs affecting K ⁺ channel inactivation 3) Plant-derived chemicals influencing adipogenesis

HONDA, Hajime *	Cell Motility Biomotor Devices	1) Motor Protein 2) Fluorescent Microscopy 3) Biosensor Device 4) LSI
MASAI, Eiji	Applied Microbiology	1) Bacterial catabolism of aromatic compounds, including lignin-derived compounds 2) Microbial technology for woody biomass (lignin) utilization

ASSOCIATE PROFESSORS

NAME	RESEARCH FIELD	RESEARCH TOPICS
OHNUMA, Kiyoshi	Tissue engineering Regenerative medicine	1) Human induced pluripotent stem cells (iPSCs) 2) Microfabrication, Microfluidic 3) Development and differentiation
KASAI, Daisuke	Applied Microbiology	1) Biodegradation of environmental pollutants 2) Microbial degradation of rubber
KAMIMURA, Naofumi	Applied Microbiology	1) Bacterial catabolism of aromatic compounds, including lignin-derived compounds 2) Microbial technology for woody biomass (lignin) utilization 3) Bacterial sensor for the detection of lignin biodegradation
KUWAHARA, Takashi	Bioelectrochemistry	1) Hybridization of synthetic polymers and bio-related substances 2) Modification of solid surface with bio-related substances (Application to biosensors and biofuel cells)
SATO, Takeshi	Glycobiology Molecular Biology Functional Biochemistry	1) Development of effective system for suppression of malignant properties of cancer cells by manipulation of transcription factors 2) Elucidation of transcriptional mechanisms of glycogens 3) Study on effects of anti-cancer drugs on glycan structures
SHIDA, Yosuke	Applied microbiology Gene regulation of fungi Utilization of cellulosic biomass	1) Gene regulation mechanism of filamentous fungi 2) Lipids and carotenoids production by oleaginous yeast 3) Conversion of cellulosic biomass into value added materials
SHIMODA, Yasushi	Neuroscience Biochemistry	1) Cell adhesion molecules in the regulation of neural function 2) Mechanism of psychiatric and developmental disorders 3) Regulation of neural function by protein engineering
TAKAHARA, Yoshinori	Breeding science	1) Plant Biotechnology 2) Molecular Marker Assisted Selection 3) Genetic Transformation 4) Evolution
NISHIMURA, Taisuke	Plant molecular genetics	1) Plant genetic engineering 2) Genomics 3) Epigenetics 4) Reprogramming

FUJIWARA, Ikuko	Actin polymerization and depolymerization dynamics Regulatory mechanism for cytoskeleton Molecular mechanism of cell motility	<ol style="list-style-type: none"> 1) Total Internal Reflection Fluorescence Microscope 2) Individual actin filaments polymerization and depolymerization 3) Real time observation of protein binding and dissociation related with cytoskeleton and cell motility
YAMAMOTO, Maki	Wild life Management Bio-logging Conservative Biology Ecology	<ol style="list-style-type: none"> 1) Field Study for Wild Animals Using Bio-logging technique 2) GIS Analysis for Wildlife Management
