Mechanical engineering covers fields concerning development, design, production, inspection, and maintenance of various kinds of equipment, or machines, which enable us to make human-life and human-work convenient. Its main subjects are materials and strength, motion and control, design and production, and energy and environment. Mechanical engineering treats with equipment in various sizes from a large oil tanker to an atomic force microscope. Computers play very important roles in all those fields. A student in this major course studies the forefront of each subject and technology together with management engineering subjects and cultivates one's ability to find and solve engineering problems through seminars and researches for the master's thesis. The objectives of this major are directed not only toward the research and development for the functionally organized following three courses but also to the education to incubate the pioneering engineers who are rich in vitality, originality and service, i.e. VOS in abbreviation.

Research Areas

Electric Energy and Control Engineering

Activity in this research area focuses on the following topics: new energy systems, plasma applications, pulsed-power technology, electric power systems, energy conversion and control, motion control and robotics, industrial and transportation systems, home appliances, and new materials for energy systems. Research and development for enhancing and improving functionality and performance of those systems are demanded by human society in view of reducing the global environmental load.

The energy and electric power supply systems, the hubs of the transformation and distribution of energy, are of immense importance to our sophisticated modern society. This course has advanced its performance due to the development of new material parts for electronic devices. In fact the demands of society on the electric and electronic systems are becoming increasingly sophisticated, leading to multiplying components and a deepening relation with other disciplines. In order to coincide with such demands of modern industrial society, the important themes are how to develop electric and energy systems anchoring an integrated relation with the other disciplines and also how to develop the electronic devices which may be involved in such an electric power system. The continuous target of the energy systems research field is to study and develop energy and related systems in order to support the dynamism of modern and future society.

In this course, fundamental scholastic ability and practice-minded knowledge are cultivated through education of the corresponding undergraduate course. Also, due to the close interrelationship with other two courses in this major, knowledge of system application is to be deepened.

Electronic Devices and Light Wave Control Engineering

This research area consists of solid electronic engineering, semi-conducting material engineering, energy transforming element engineering and opto-electronics.

Electronic devices which utilize the basic properties of semi-conductors, magnetic substances, super-

conductors and dielectric substances are studied with regard to their properties and functions, including production technology, with the objective of improving the properties of electronic devices and developing new electronic and opto-electronic devices with new technology.

Electronic engineering plays an important role in modern society, contributing to wide areas including domestic electronic appliances, electronic computers, control devices and electronic devices for educational and medical use. It is to be said that electronic engineering has become indispensable to every aspect of science and technology. Therefore, it is no exaggeration to say that the future development of science and technology depends on the close interrelation of electronic engineering to all other disciplines. Because of this reasoning, great expectations are held of leading engineers to partake in the development and production of electronic devices to support future development.

In addition fundamental scholastic ability and practice-minded knowledge are cultivated through education of the corresponding undergraduate course. Furthermore, due to the close interrelationship with other two courses in this major, knowledge of system application is to be deepened.

Information, Telecommunication and Control Systems

This research area is concerned with studying the information and telecommunication systems which are considered to be worthwhile in the present global age supported by the diverging evolution of the information technology.

Activity in this research area is focused on the following disciplines: electronic computer engineering, human information processing, mathematical informatics, digital signal processing, human interface and sound communication systems, multi-media information processing, electric circuit theory, knowledge-based information processing, and natural language processing, and cybernetics. These research fields are closely related to the previously mentioned two courses because the information technology may play a crucial role as an infra-technology in the modern industrial society which requires global human communication systems as is well appreciated nowadays. Performance-improving developments and new proposals in these areas are among the main priorities determining the research area activity.

In similar to the above-mentioned two courses, fundamental scholastic ability and practice-minded knowledge are cultivated through education of the corresponding undergraduate course. In addition, due to the close interrelationship with other two courses in this major, knowledge of system application is to be deepened.

3. Information and Management Systems Engineering

It is clear that Information & Communication Technology (ICT) is transforming not only ways of doing business but also the basis of society as we know it and that it will increasingly be the key to the creation of successful and competitive businesses in the future.

However, the successful transition to the new information society will require not only the development of groundbreaking new information technology itself but also the expertise to take full advantage of the strategic potential of information technology. Although leading the world in many areas of electronics, data processing and communication technology, Japan lags behind in the application of ICT to creation of innovative new management and social systems. This situation is undoubtedly due in large part to a shortage of highly-skilled manpower with sufficient mastery of the new technology to develop new applications for the design, implementation and control of management information systems.

The objective of this Department is to study information and management systems and to train specialists with the expertise knowledge and skills necessary to develop the vast potential of information and management technology and to do so with an appreciation of socioeconomic environment of the real world. Such expertise is necessary to imagine totally new and different social structures and to develop innovative ways of organizing and managing businesses.

Research Areas

Subject Organization

Nuclear technology involves the application of safety technology and safety management to fundamental nuclear technologies, and is centered on ensuring safety for each target device. The subjects in this major include both compulsory subjects and elective subjects, which are divided into 3 main categories: 1) Advanced Radiation Engineering, 2) Nuclear System Engineering, and 3) Nuclear Safety Engineering.

7. System Safety Engineering

In an integrated composite of hardware/software, humans, laws/criteria and so on, to achieve the acceptable risk throughout all phases of the life cycle such as design, production and use, it is required to reveal all hazards in advance systematically and to analyze and evaluate the effects of those on the associated risks and finally to take adequate safety measures. System safety is a discipline which integrates and applies both safety technologies and safety management skills to perform all the required actions mentioned above. The objective of this department is to provide engineering education to students, based on the concept of system safety, so as to become researchers and practical professional experts.

Research Areas

Safety-Certification

In order for industry to maintain and develop its international competitiveness with foreign countries, knowledge of internationally organized safety certification is indispensable. In this area, we conduct technological development and research related to safety certification. For example, it involves learning and understanding the basic knowledge of safety certification, developing a new safety certification scheme, study on new safety certification standards, and the validity of newly proposed international standards. Graduates can acquire advanced knowledge, practical ability, and research ability to carry out their duties as leaders such as safety certification of their own products at manufacturers, product certification at safety certification companies, and so on.

Safety Standard and Design

This research area covers safety standards and design methods. The education and research work on safety standards deal with the concept and structure of safety standards and how to understand “safety.” Safety standards are mainly international, regional and national standards and these standards often have relation with regulations. The education and research work on design methods deal with the design procedure globally accepted and established. Based on these fundamentals on safety design, considerations how to apply to the design procedures for the extend field with advanced technology, such as functional safety using AI, IoT and so on, are current topics in this field.

Safety Management

Since the pioneering work of W. H. Heinrich in the early 20th century, safety management of workplaces has been the most important area of scientific studies for safety researchers and professionals. How to design organizations, train staff, motivate employees, and make a scientific analysis of causes of injury are the most commonly asked questions among safety professionals. In the latter half of the 20th century, traffic safety, complex socio-technical systems safety, medical safety, and consumer safety emerged as new areas for safety management studies. Several new questions, such as how to design social, institutional and legal environments, how to analyze psychological aspects of human behavior, and so on, have been added to the research agenda. In the coming years, along with the extensive use of information technologies, how to manage safety data will become another important topic for safety professionals.
